Honeypot IDS – Pool test report

Generated: 2026-10-09 12:59:02
Target: ids (local) (https://localhost)
Exploits: A: CVE-2024-2387, B: CVE-2025-47577, C: GENERIC-WP-003, D: CVE-2024-27956, E: CVE-2022-0739, F: CVE-2024-2879, G: CVE-2023-2986, H: CVE-2025-2266, J: GENERIC-XSS-001, I: GENERIC-SQLI-001, A: CVE-2024-1071, B: CVE-2025-4403, C: GENERIC-WP-002, D: CVE-2024-1071, E: CVE-2025-4403, F: GENERIC-WP-002, G: CVE-2024-1071, H: CVE-2025-4403, I: GENERIC-WP-002, J: CVE-2024-1071
Windows: 10

Result

SHARED EXPECTED **Pools are shared, as expected under resource pressure**

- Pool 4 is shared by Attacker D, Attacker J.
- Pool 5 is shared by Attacker E, Attacker I.
- This is the designed fallback: pool growth is capped (resource limit reached: 8 pools reserve 12288 MB of POOL_MAX_MEMORY_MB=12288), so further attackers were assigned to the ready pools round-robin.
- Window 1: cart could not be read in 'Attacker G attacks with CVE-2023-2986'.
- Window 3: cart could not be read in 'Attacker G attacks with CVE-2023-2986'.
- Window 8: cart could not be read in 'Attacker G attacks with CVE-2023-2986'.
- Window 9: cart could not be read in 'Attacker G attacks with CVE-2023-2986'.
- Window 10: cart could not be read in 'Attacker G attacks with CVE-2023-2986'.
- Pool 1 (owned by window A) also served window(s) E.
- Pool 2 (owned by window B) also served window(s) F.
- Pool 3 (owned by window C) also served window(s) G.
- Pool 4 (owned by window J) also served window(s) D.
- Pool 5 (owned by window I) also served window(s) E.

What is being tested

Attackers are told apart by session, not by address. Each test window has its own cookie jar and its own User-Agent and language, so the proxy sees 10 separate attackers. By default every malicious session is given a honeypot pool **of its own** (an eshop container with its own seeded database): the router hands a new attacker a free ready pool no other session owns, and the pools scale with the attacker sessions – a session that finds no free pool borrows one round-robin while pool_manager builds one for it, then moves there. Scaling stops at the configured resource limit (POOL_MAX_MEMORY_MB / POOL_MAX_CPUS / POOL_MAX) or when the host is short of memory, CPU or disk; from then on further attackers share the ready pools in strict round-robin order.

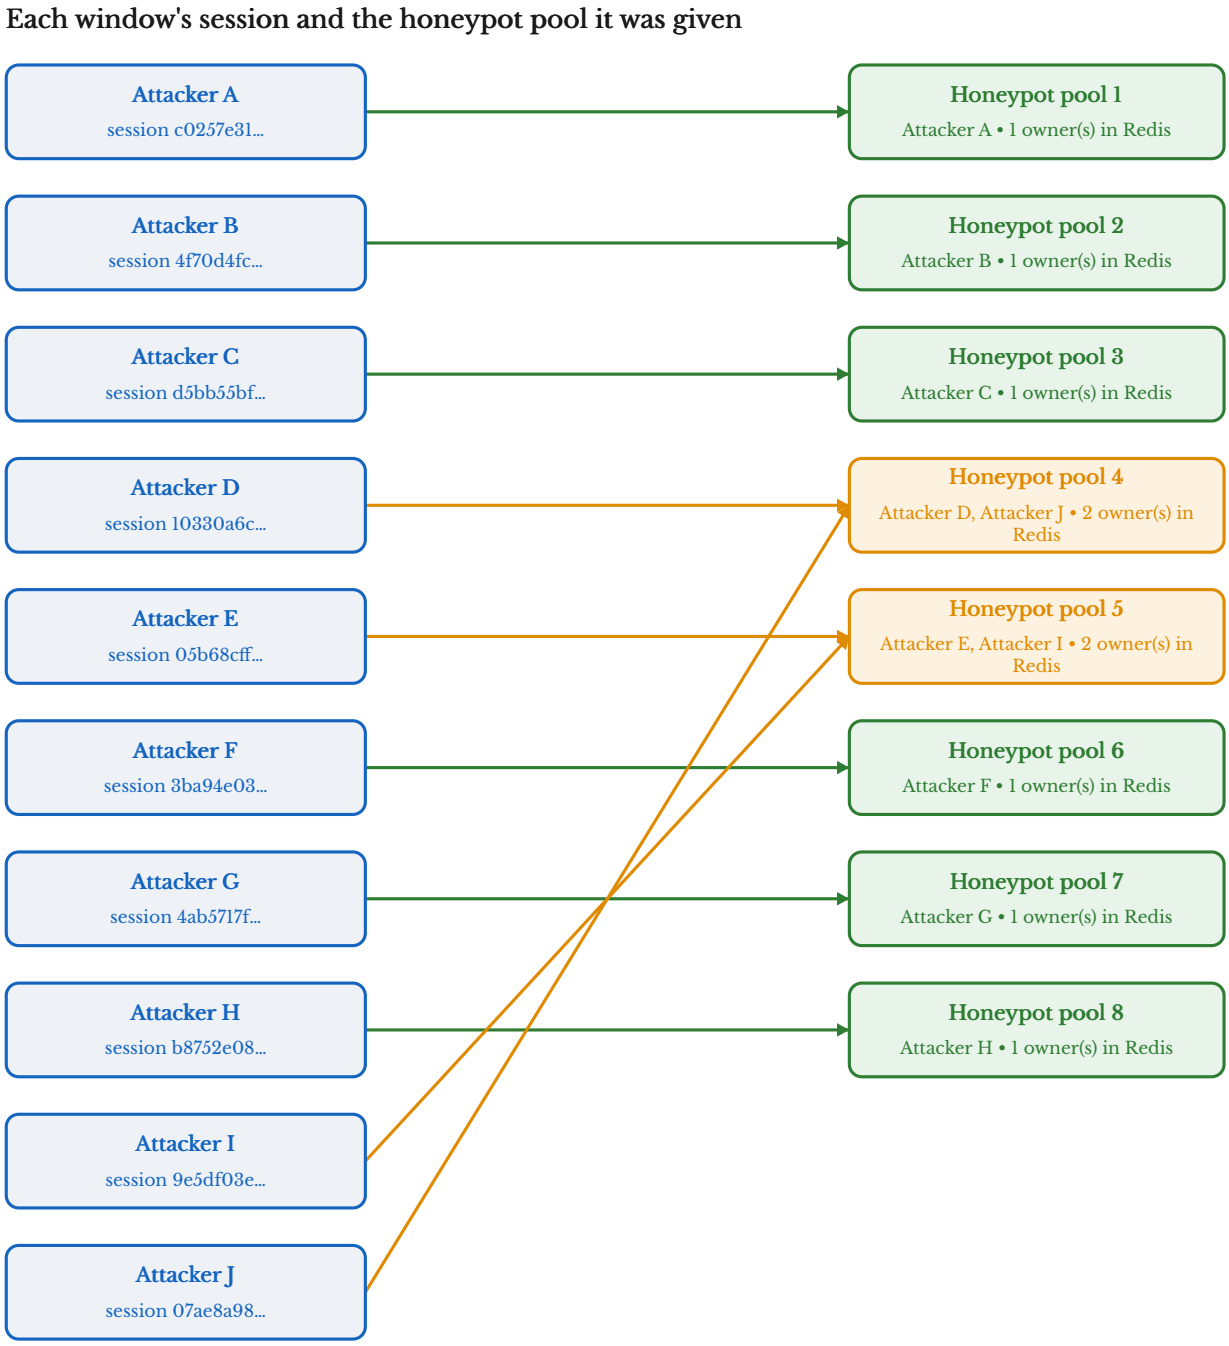

Figure 1. One arrow per test window, from its session to the honeypot pool the router bound it to. Green: the pool belongs to that window alone. Orange: shared under resource pressure (designed). Red: shared or merged without a reason. Grey: not bound.

Windows

Window	Session	Honeypot pool	Language	User-Agent (tail)

Scaling and latency

pool_manager adds one honeypot pool (an eshop container plus its own database seeded from production) for every attacker session that finds no free pool, up to the resource limit. These figures come from pool_manager's own event log (build phases, hand-overs with their wait time, resource-limit changes) and from the windows themselves (routing read after every step and every 2 s while waiting; the duration of each page load).

Windows	10, of which 3 attacked only after pools were pre-built for them
Run time	6:02
Resource limit	12288 MB, 12 CPUs, POOL_MAX 10 (a pool reserves 1536 MB / 1.5 CPUs); 8 pool(s) exist, room for 0 more
Pools added during the run	4 built; build time median 55 s, max 59 s
Round-robin while not scaled yet (case A)	3 window(s) borrowed a pool; moved to their own after median 46 s, max 80 s
Round-robin at the resource limit (case B)	3 window(s) share a pool for good; limit first reached at 2:12 (resource limit reached: 8 pools reserve 12288 MB of POOL_MAX_MEMORY_MB=12288)
Forced scale-down at the end	8 → 3 pool(s) in 15 s
Pre-build for the delayed windows	1 of 3 ready after 8 s (growth capped: resource limit reached: 8 pools reserve 12288 MB of POOL_MAX_MEMORY_MB=12288)

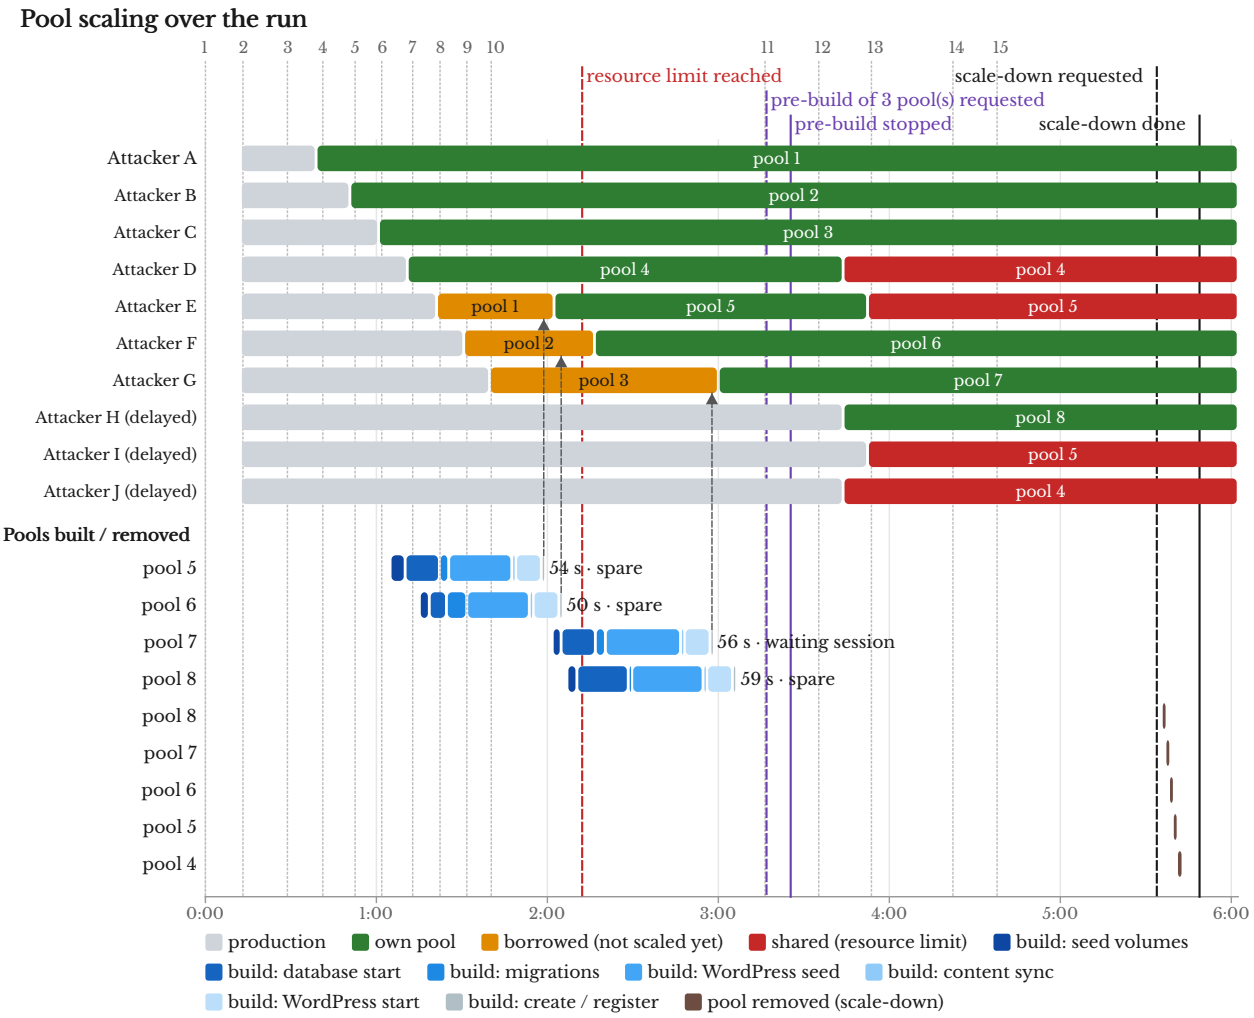

Figure 2. Where each window was served over the run (grey: production, green: its own pool, orange: a borrowed pool while its own was being built, red: shared because the resource limit was reached), and every pool built during the run, its phases shaded dark to light. Dashed grey arrows: a finished pool handed to the window that waited for it. Numbered dotted lines: the steps below.

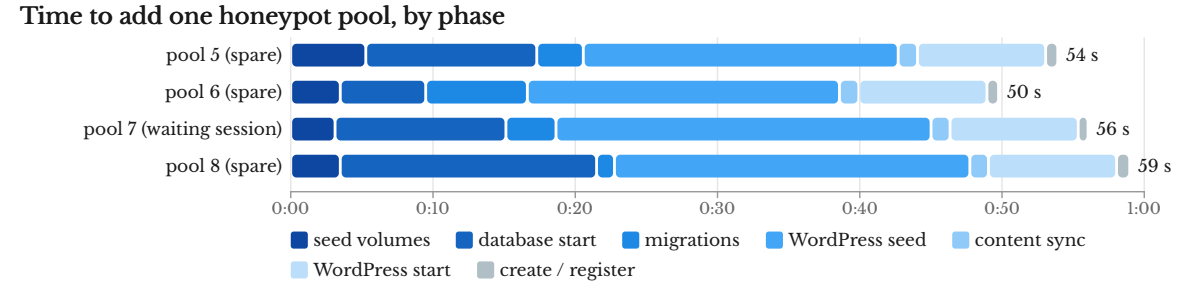

Figure 3. Latency of adding one honeypot pool: wall time from the decision to build it until it was registered healthy, split into pool_manager's phases.

Pool	Built for	Started	Build time	Phases
5	spare	1:05	54 s	seed volumes 5 s, database start 12 s, migrations 3 s, WordPress seed 22 s, content sync 1 s, WordPress start 9 s
6	spare	1:15	50 s	seed volumes 3 s, database start 6 s, migrations 7 s, WordPress seed 22 s, content sync 1 s, WordPress start 9 s
7	waiting session	2:02	56 s	seed volumes 3 s, database start 12 s, migrations 4 s, WordPress seed 26 s, content sync 1 s, WordPress start 9 s

8	spare	2:07	59 s	seed volumes 3 s, database start 18 s, migrations 1 s, WordPress seed 25 s, content sync 1 s, WordPress start 9 s

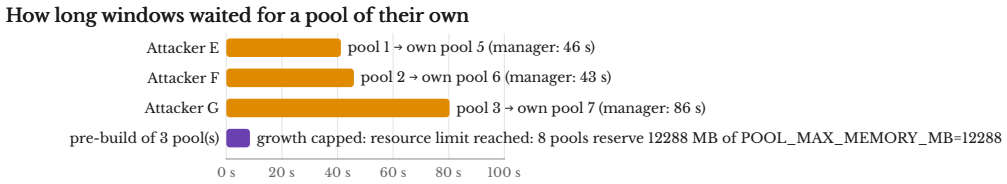

Figure 4. Orange: time a window spent on a borrowed pool (assigned round-robin because no pool was free yet) until it was moved to the pool built for it, as seen by the window (2 s resolution); pool_manager's own measurement in brackets. Red: the window was left on the borrowed pool because the resource limit was reached. Purple: time to pre-build the pools for the delayed windows.

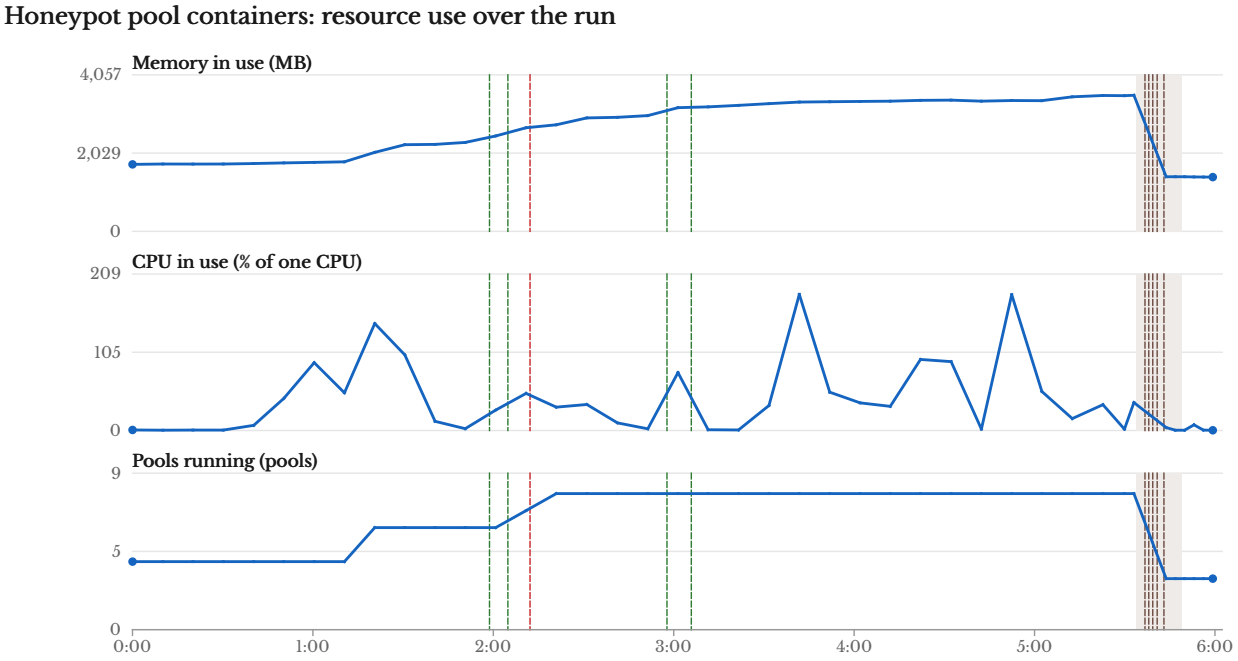

Figure 5. Memory, CPU and number of running honeypot pools (eshop + database containers, docker stats every 10 s, every 3 s around the scale-down). Dashed lines: green a pool finished building, red the resource limit was reached, brown a pool was removed. Shaded: the forced scale-down at the end of the run.

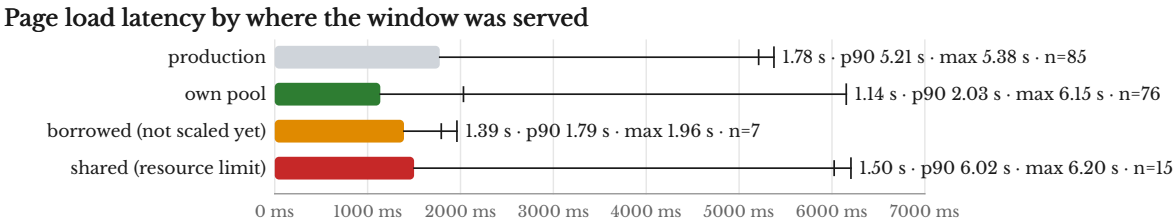

Figure 6. Every page load of every window during the run (browser navigation start to load finished), grouped by where that window was routed right after it. Bar: median; short tick: 90th percentile; line end: slowest load.

Round-robin assignment

A diverted session is only ever put on a pool another session uses in two situations, both handled round-robin over the ready pools:

A. Not scaled up yet (no free pool, more can be built)

Window	Borrowed	From	Until	Waited	Outcome
Attacker E	pool 1	1:21	2:02	41 s (pool_manager: 46 s)	moved to its own pool 5
Attacker F	pool 2	1:31	2:17	46 s (pool_manager: 43 s)	moved to its own pool 6
Attacker G	pool 3	1:40	3:00	80 s (pool_manager: 86 s)	moved to its own pool 7

B. Resource limit reached (no more pools can be built)

Growth capped at 2:12: resource limit reached: 8 pools reserve 12288 MB of POOL_MAX_MEMORY_MB=12288

Window	Pool	Since	Shares with	How
Attacker H	pool 8	3:44	a session outside the test	assigned while capped
Attacker I	pool 5	3:52	Attacker E	assigned while capped
Attacker J	pool 4	3:44	Attacker D	assigned while capped

Scale-down

pool_manager scales down a pool once no request has reached it for POOL_IDLE_TIMEOUT_SECONDS = 1800 s (30:00): its attackers' assignments are dropped (a returning attacker is assigned afresh) and pools above the spare count (1) are removed with their volumes, freeing what they reserved. Compose-declared pools are only freed, never removed. Waiting that long is not practical in a test, so the run ends by forcing it: the windows stop sending requests, their sessions are released, and pool_manager removes the pools that are no longer needed at once. Other sessions' pools are not touched.

Requested at	5:34
Sessions released	10
Finished	after 15.0 s
Pools	8 → 3 (1, 2, 3, 4, 5, 6, 7, 8 → 1, 2, 3)
Pools removed	pool 8 (1.3 s), pool 7 (1.3 s), pool 6 (1.3 s), pool 5 (1.5 s), pool 4 (2.2 s)
Reserved by container limits	12,288 MB / 12 CPUs → 4,608 MB / 4.5 CPUs
Memory in use (measured)	3,528 MB → 1,410 MB (-2,118 MB)
CPU in use (measured)	37 % → 8 %
Containers running	16 → 6

Cart persistence

A visitor diverted to a honeypot is served by a different database, so WooCommerce's own cart session does not exist there. The storefront therefore carries the cart in a cookie and rebuilds it on whichever instance serves the next request. Each window filled its cart on production; the cart was then read back after every step, through the same cookies and routing as the window's own traffic.

Step	Attacker A	Attacker B	Attacker C	Attacker D	Attacker E	Attacker F	Attacker G	Attacker H	Attacker I	Attacker J
All windows open the shop	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production

Step by step

All windows move in every step. An attacker's pool must appear in their own step, differ from the earlier ones, and never change afterwards – except once, from a pool it only borrowed while its own was being built to that new pool.

Step 1: All windows open the shop

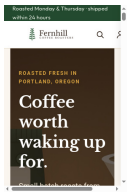

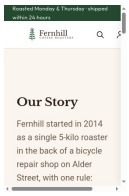

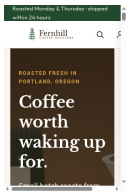

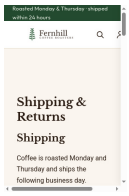

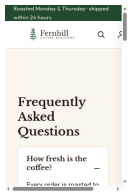

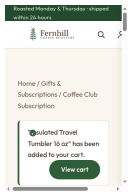

10 new sessions, all routed to production.

Attacker A	Attacker B	Attacker C	Attacker D	Attacker E	Attacker F	Attacker G	Attacker H	Attacker I	Attac r J
Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browse the sho

cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty
									

Step 2: Every window fills its cart

Each window adds its own products. These carts are the baseline: they must look exactly the same after the session is routed to a honeypot pool.

Step 7: Attacker E attacks with CVE-2022-0739

BookingPress SQL injection. The session must be bound to a pool no other window has -- or, when no pool is free yet, borrow one round-robin until the pool being built for it is ready -- and the windows that have not attacked yet must stay on production.

Step 10: Honeypot pools scale up

Windows that found no free pool (not scaled up yet) borrowed a ready one round-robin while pool_manager built a pool (eshop + seeded database) for each of them, and must now each be in their own. Once the resource limit is reached no more pools are built and the remaining windows keep sharing the ready pools round-robin.

Step 11: Pools pre-built for 3 delayed window(s)

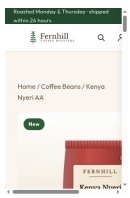

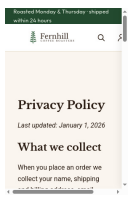

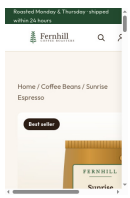

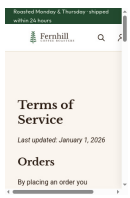

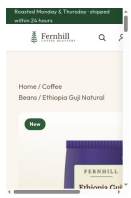

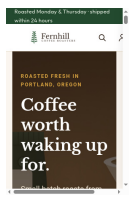

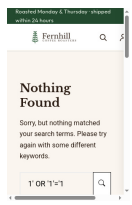

Before windows H, I, J attack, the test asks pool_manager for 3 free pool(s) and waits until they are ready, so these windows find a pool of their own the moment they are diverted instead of borrowing one round-robin. If the resource limit stops the build first, they share the ready pools round-robin instead.

Step 12: Delayed windows H, I, J attack together

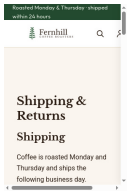

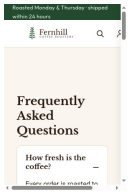

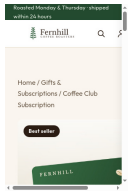

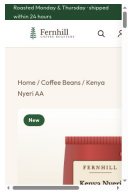

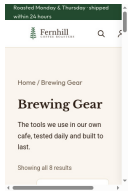

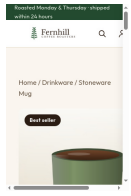

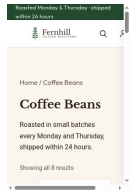

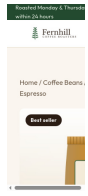

These windows attack only now that pools were built for them: each must get a free pool of its own at once (no borrowing) -- unless the resource limit stopped the build, in which case they share the ready pools round-robin.

What each honeypot container saw and changed

Read from each pool's own eshop and database containers since the run started (2026-10-09T10:52:56Z). Requests are matched to windows by their User-Agent tag, so a pool should show its owner's exploits and nobody else's. A pool no window owns is shown for contrast.
