Honeypot IDS – Pool test report

Generated: 2026-10-16 11:18:04
Target: ids (local) (https://localhost)
Exploits: A: CVE-2024-2387, B: CVE-2025-47577, C: GENERIC-WP-003, D: CVE-2024-27956, E: CVE-2022-0739, F: CVE-2024-2879, G: CVE-2023-2986, H: CVE-2025-2266, J: GENERIC-XSS-001, I: GENERIC-SQLI-001, A: CVE-2024-1071, B: CVE-2025-4403, C: GENERIC-WP-002, D: CVE-2024-1071, E: CVE-2025-4403, F: GENERIC-WP-002, G: CVE-2024-1071, H: CVE-2025-4403, I: GENERIC-WP-002, J: CVE-2024-1071
Windows: 10
Browser data cleared: 5 time(s), in random windows

Result

EXCLUSIVE **Every attacker has a honeypot pool of their own**

- Attacker A → pool 1, Attacker B → pool 2, Attacker C → pool 3, Attacker D → pool 4, Attacker E → pool 5, Attacker F → pool 6, Attacker G → pool 7, Attacker H → pool 8, Attacker I → pool 10, Attacker J → pool 9.
- Pool 6 (owned by window F) also served window(s) E, which neither borrowed nor shares it.

What is being tested

Attackers are told apart by session, not by address. Each test window has its own cookie jar and its own User-Agent and language, so the proxy sees 10 separate attackers. By default every malicious session is given a honeypot pool **of its own** (an eshop container with its own seeded database): the router hands a new attacker a free ready pool no other session owns, and the pools scale with the attacker sessions – a session that finds no free pool borrows one round-robin while pool_manager builds one for it, then moves there. Scaling stops at the configured resource limit (POOL_MAX_MEMORY_MB / POOL_MAX_CPUS / POOL_MAX) or when the host is short of memory, CPU or disk; from then on further attackers share the ready pools in strict round-robin order.

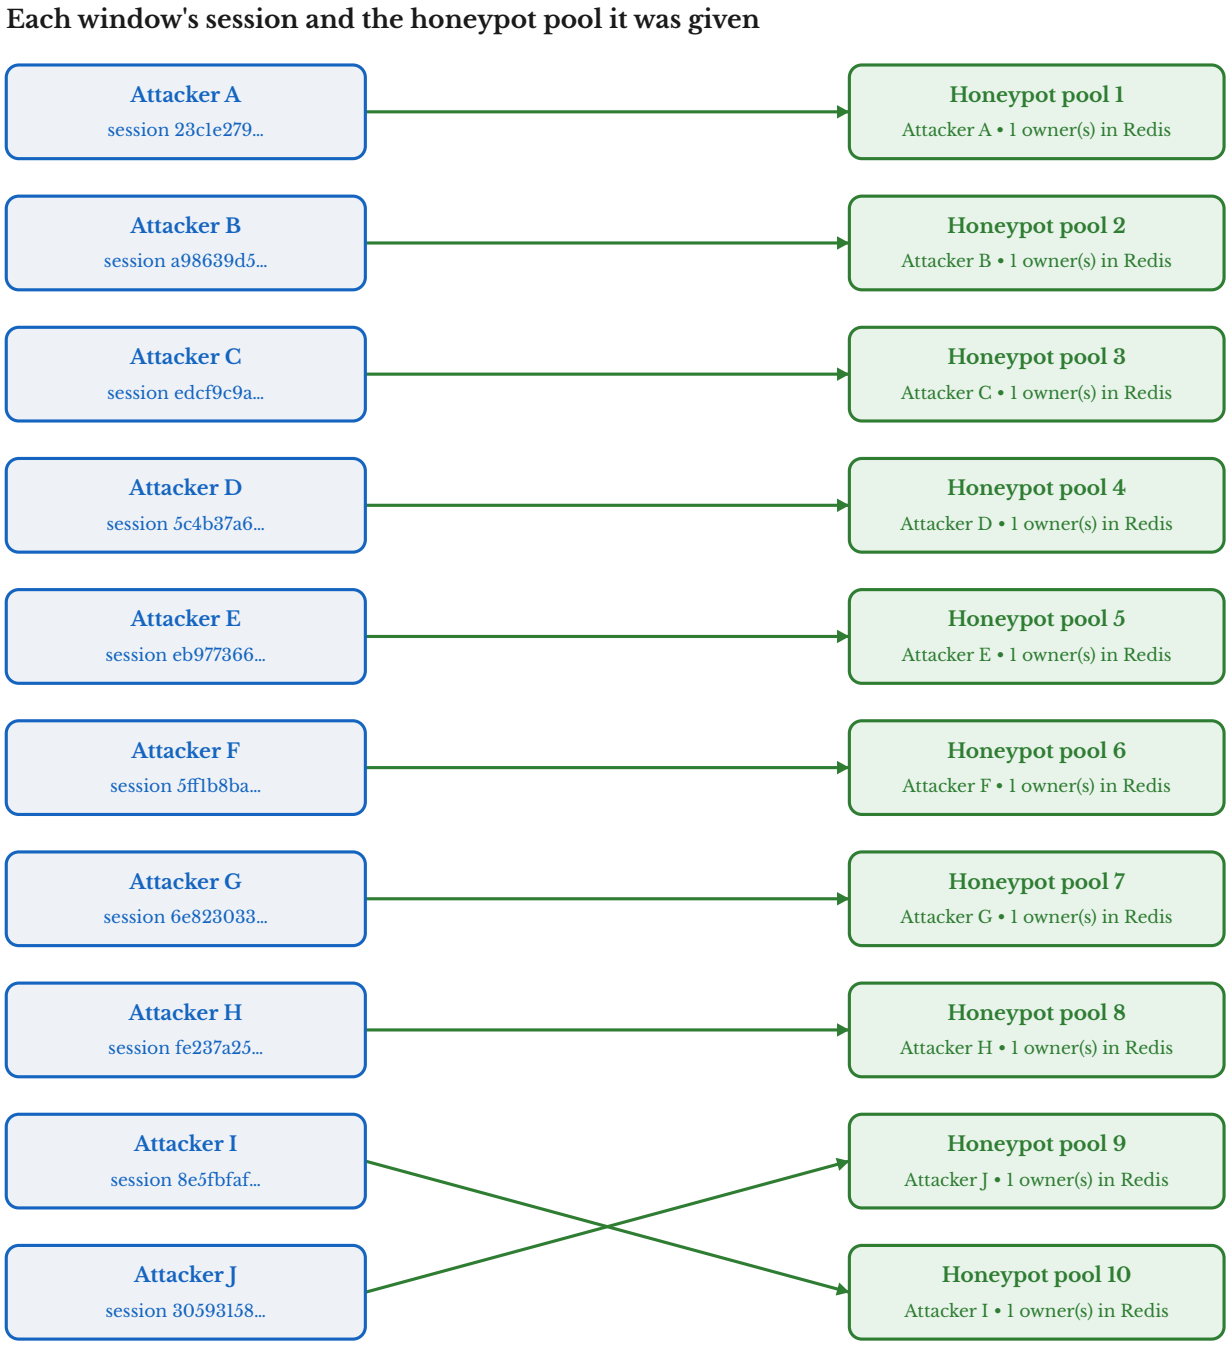

Figure 1. One arrow per test window, from its session to the honeypot pool the router bound it to. Green: the pool belongs to that window alone. Orange: shared under resource pressure (designed). Red: shared or merged without a reason. Grey: not bound.

Windows

Window	Session	Honeypot pool	Language	User-Agent (tail)

Windows clearing their browser data

Between steps, random windows cleared their own data the way a regular visitor does from the browser's settings: every cookie of the site, its localStorage and sessionStorage, or both. Nothing was forged or rewritten. The table shows what each window had before, and the session and route the stack gave it once the next step settled. A window that lost its cookies also lost WooCommerce's cart cookie, so its cart starts over there. Random seed: 1039697770.

5 clearing(s): 5 kept their session, 0 got a fresh one.

Time	Before step	Window	Cleared	Session before	Session after	What the stack did
0:54	4: Attacker B attacks with CVE-2025-47577	**Attacker F**	cleared all site data (cookies, localStorage, sessionStorage) 10 cookie(s) (SERVERID, fh_cart, sbjs_current_add, sbjs_first, sbjs_first_add, sbjs_migrations, sbjs_session, woocommerce_cart_hash, woocommerce_items_in_cart, wp_woocommerce_session_86a9106ae65537651a8e456835b316ab), 0 storage entries	5ff1b8ba… production	5ff1b8ba… production	same session kept its session, served by production
1:10	5: Attacker C attacks with GENERIC-WP-003	**Attacker I**	cleared all site data (cookies, localStorage,	8e5fbfaf… production	8e5fbfaf… production	same session kept its session, served by production

			sessionStorage) 10 cookie(s) (SERVERID, fh_cart, sbjs_current_add, sbjs_first, sbjs_first_add, sbjs_migrations, sbjs_session, woocommerce_cart_hash, woocommerce_items_in_cart, wp_woocommerce_session_86a9106ae655376518e456835b316ab), 0 storage entries			
1:49	7: Attacker E attacks with CVE-2022-0739	**Attacker C**	cleared its cookies 9 cookie(s) (SERVERID, fh_cart, sbjs_current_add, sbjs_first, sbjs_first_add, sbjs_migrations, sbjs_session, woocommerce_items_in_cart, wp_woocommerce_session_86a9106ae655376518e456835b316ab)	edcf9c9a… pool 3	edcf9c9a… pool 3	**same session** kept its session, served by pool 3
2:28	9: Attacker G attacks with CVE-2023-2986	**Attacker B**	cleared its localStorage and sessionStorage 0 storage entries	a98639d5… pool 2	a98639d5… pool 2	**same session** kept its session, served by pool 2
14:53	14: All windows run a second exploit	**Attacker F**	cleared its cookies 6 cookie(s) (SERVERID, sbjs_current_add, sbjs_first, sbjs_first_add, sbjs_migrations, sbjs_session)	5ff1b8ba… pool 6	5ff1b8ba… pool 6	**same session** kept its session, served by pool 6

Scaling and latency

pool_manager adds one honeypot pool (an eshop container plus its own database seeded from production) for every attacker session that finds no free pool, up to the resource limit. These figures come from pool_manager's own event log (build phases, hand-overs with their wait time, resource-limit changes) and from the windows themselves (routing read after every step and every 2 s while waiting; the duration of each page load).

Windows	10, of which 3 attacked only after pools were pre-built for them
Run time	21:18
Resource limit	12288 MB, 12 CPUs, POOL_MAX 10 (a pool reserves 768.0 MB / 0.75 CPUs); 10 pool(s) exist, room for 0 more
Pools added during the run	7 built; build time median 141 s, max 157 s
Round-robin while not scaled yet (case A)	4 window(s) borrowed a pool; moved to their own after median 145 s, max 196 s
Round-robin at the resource limit (case B)	0 window(s) share a pool for good; limit first reached at 5:26 (high load: 30.55 on 20 CPUs, limit 1.5 per CPU)
Forced scale-down at the end	10 → 3 pool(s) in 97 s
Pre-build for the delayed windows	3 pool(s) ready after 213 s

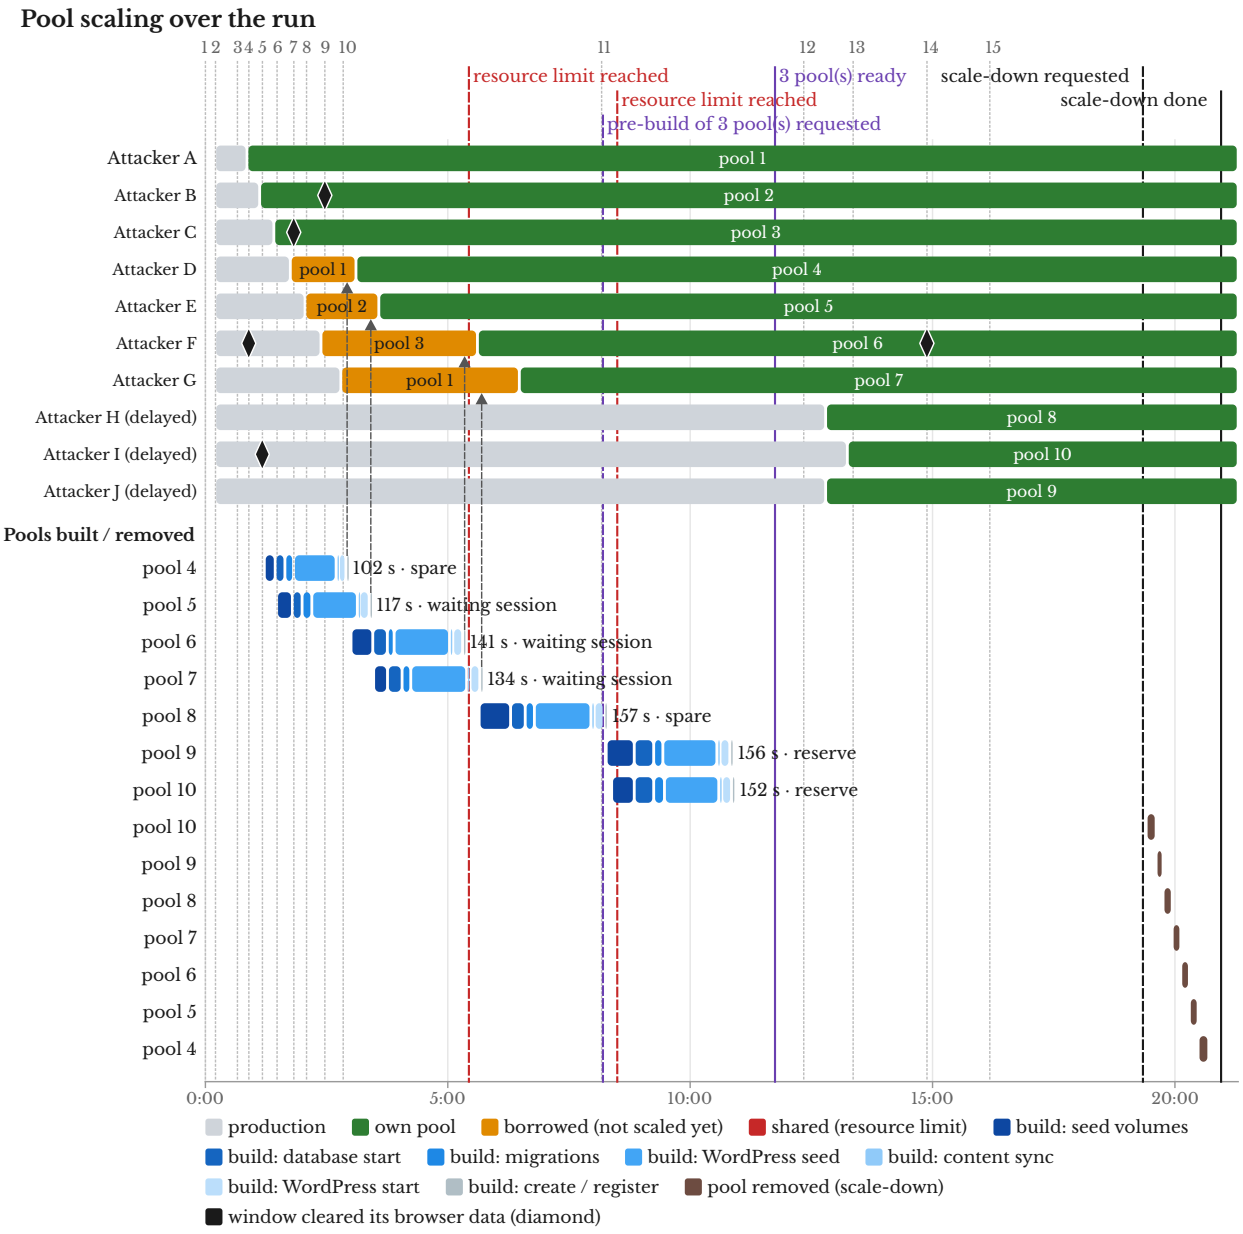

Figure 2. Where each window was served over the run (grey: production, green: its own pool, orange: a borrowed pool while its own was being built, red: shared because the resource limit was reached), and every pool built during the run, its phases shaded dark to light. Dashed grey arrows: a finished pool handed to the window that waited for it. Numbered dotted lines: the steps below. Black diamonds: a window cleared its browser data.

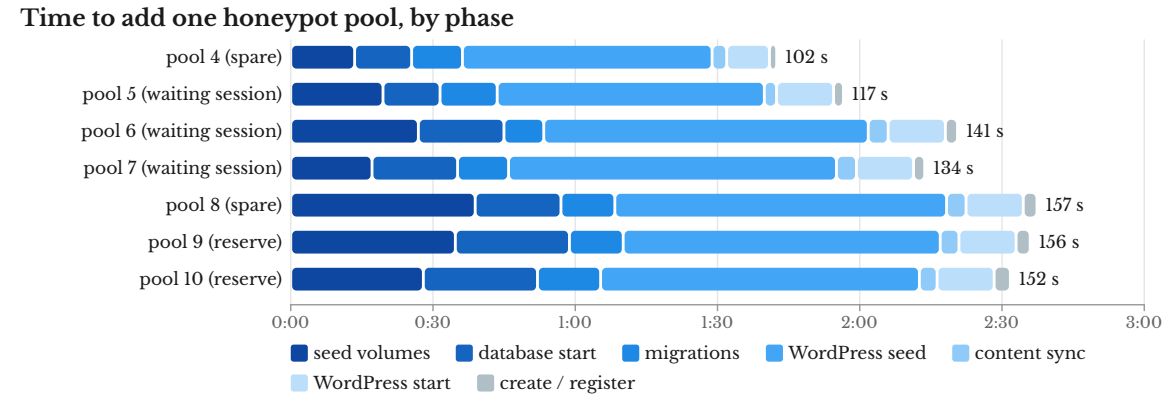

Figure 3. Latency of adding one honeypot pool: wall time from the decision to build it until it was registered healthy, split into pool_manager's phases.

Pool	Built for	Started	Build time	Phases
4	spare	1:13	102 s	seed volumes 13 s, database start 12 s, migrations 11 s, WordPress seed 53 s, content sync 3 s, WordPress start 9 s
5	waiting session	1:28	117 s	seed volumes 19 s, database start 12 s, migrations 12 s, WordPress seed 56 s, content sync 3 s, WordPress start 12 s
6	waiting session	3:00	141 s	seed volumes 27 s, database start 18 s, migrations 8 s, WordPress seed 68 s, content sync 4 s, WordPress start 12 s
7	waiting session	3:28	134 s	seed volumes 17 s, database start 18 s, migrations 11 s, WordPress seed 69 s, content sync 4 s, WordPress start 12 s
8	spare	5:39	157 s	seed volumes 39 s, database start 18 s, migrations 11 s, WordPress seed 70 s, content sync 4 s, WordPress start 12 s
9	reserve	8:16	156 s	seed volumes 35 s, database start 24 s, migrations 11 s, WordPress seed 67 s, content sync 4 s, WordPress start 12 s
10	reserve	8:23	152 s	seed volumes 28 s, database start 24 s, migrations 13 s, WordPress seed 67 s, content sync 4 s, WordPress start 12 s

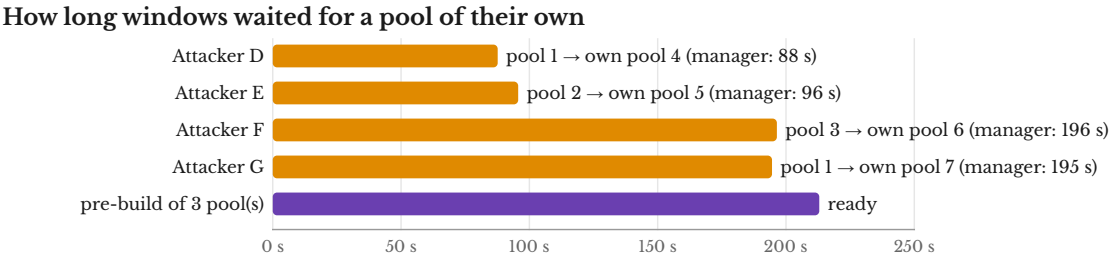

Figure 4. Orange: time a window spent on a borrowed pool (assigned round-robin because no pool was free yet) until it was moved to the pool built for it, as seen by the window (2 s resolution); pool_manager's own measurement in brackets. Red: the window was left on the borrowed pool because the resource limit was reached. Purple: time to pre-build the pools for the delayed windows.

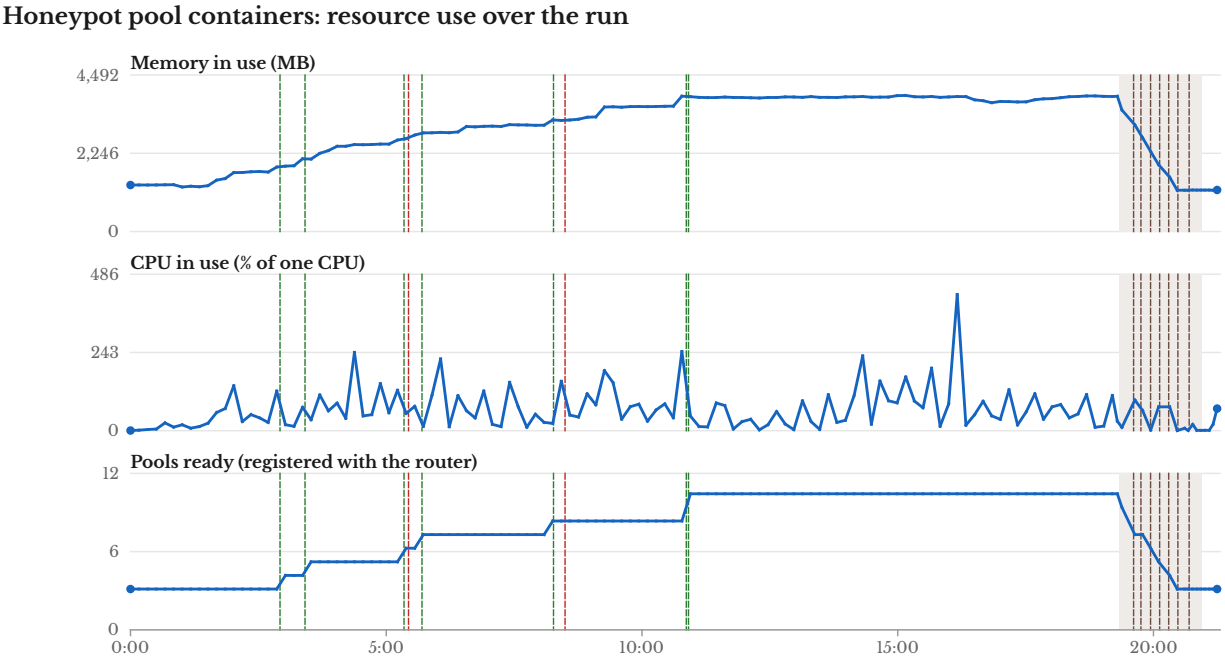

Figure 5. Memory and CPU of the honeypot pool containers (eshop + database), and the number of pools registered ready with the router (docker stats every 10 s, every 3 s around the scale-down). Dashed lines: green a pool finished building, red the resource limit was reached, brown a pool was removed. Shaded: the forced

scale-down at the end of the run.

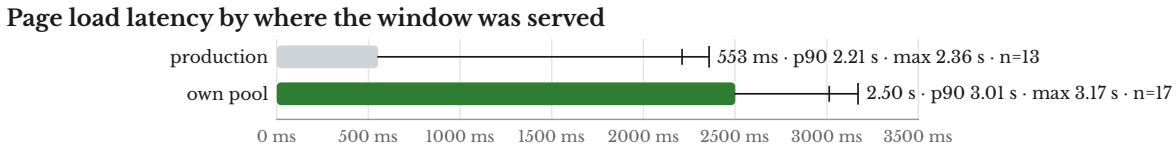

Figure 6. Latency probes: the same product page loaded by one window at a time, three times during the run (all windows on production, after the scale-up, at the end), timed from navigation start to load finished and grouped by where that window was routed right after. Bar: median; short tick: 90th percentile; line end: slowest load.

Round-robin assignment

A diverted session is only ever put on a pool another session uses in two situations, both handled round-robin over the ready pools:

A. Not scaled up yet (no free pool, more can be built)

Window	Borrowed	From	Until	Waited	Outcome
Attacker D	pool 1	1:28	2:55	88 s (pool_manager: 88 s)	moved to its own pool 4
Attacker E	pool 2	1:49	3:25	96 s (pool_manager: 96 s)	moved to its own pool 5
Attacker F	pool 3	2:04	5:21	196 s (pool_manager: 196 s)	moved to its own pool 6
Attacker G	pool 1	2:27	5:42	195 s (pool_manager: 195 s)	moved to its own pool 7

B. Resource limit reached (no more pools can be built)

Growth capped at 5:26: high load: 30.55 on 20 CPUs, limit 1.5 per CPU
Growth capped at 8:30: pool limit reached: 10 of POOL_MAX=10 pools

Not observed: the resource limit was reached, but every window diverted afterwards still found a free pool (a spare built before the limit), so nobody had to share.

Scale-down

pool_manager scales down a pool once no request has reached it for POOL_IDLE_TIMEOUT_SECONDS = 1800 s (30:00): its attackers' assignments are dropped (a returning attacker is assigned afresh) and pools above the spare count (1) are removed with their volumes, freeing what they reserved. Compose-declared pools are only freed, never removed. Waiting that long is not practical in a test, so the run ends by forcing it: the windows stop sending requests, their sessions are released, and pool_manager removes the pools that are no longer needed at once. Other sessions' pools are not touched.

Requested at	19:20
Sessions released	10

Finished	after 96.7 s
Pools	10 → 3 (1, 2, 3, 4, 5, 6, 7, 8, 9, 10 → 1, 2, 3)
Pools removed	pool 10 (12.3 s), pool 9 (8.6 s), pool 8 (11.3 s), pool 7 (10.7 s), pool 6 (10.6 s), pool 5 (10.8 s), pool 4 (13.2 s)
Reserved by container limits	7,680 MB / 7.5 CPUs → 2,304 MB / 2.25 CPUs
Memory in use (measured)	3,883 MB → 1,190 MB (-2,693 MB)
CPU in use (measured)	29 % → 1 %
Containers running	20 → 6

Cart persistence

A visitor diverted to a honeypot is served by a different database, so WooCommerce's own cart session does not exist there. The storefront therefore carries the cart in a cookie and rebuilds it on whichever instance serves the next request. Each window filled its cart on production; the cart was then read back after every step, through the same cookies and routing as the window's own traffic.

Where a window cleared its cookies (marked ◆), WooCommerce's cart cookie went with them, so the cart it filled is gone from the browser from that step on and an empty cart there is expected. If a cart shows up again after that, the browser did not bring it back: the stack restored it, and the report notes it below the table. That restored cart is then the one the later steps are compared with. Clearing only localStorage or sessionStorage leaves the cart cookie in place, so the cart must stay as it was.

Step	Attacker A	Attacker B	Attacker C	Attacker D	Attacker E	Attacker F	Attacker G	Attacker H	Attacker I	Attacker J
All windows open the shop	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production

J	CVE-2024-1071	Ultimate Member SQL injection	diverted after 1	pool 9

Step by step

All windows move in every step. An attacker's pool must appear in their own step, differ from the earlier ones, and never change afterwards – except once, from a pool it only borrowed while its own was being built to that new pool.

Step 1: All windows open the shop

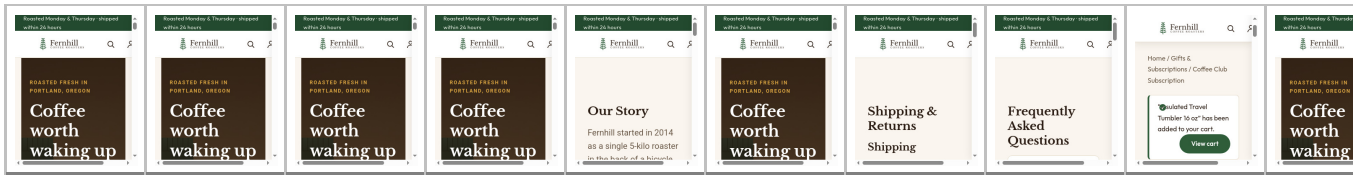

10 new sessions, all routed to production.

Attacker A	Attacker B	Attacker C	Attacker D	Attacker E	Attacker F	Attacker G	Attacker H	Attacker I	Attac rJ
Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browse the sho
PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRO UCT N no poo score 0
cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty
									

Step 2: Every window fills its cart

Each window adds its own products. These carts are the baseline: they must look exactly the same after the session is routed to a honeypot pool.

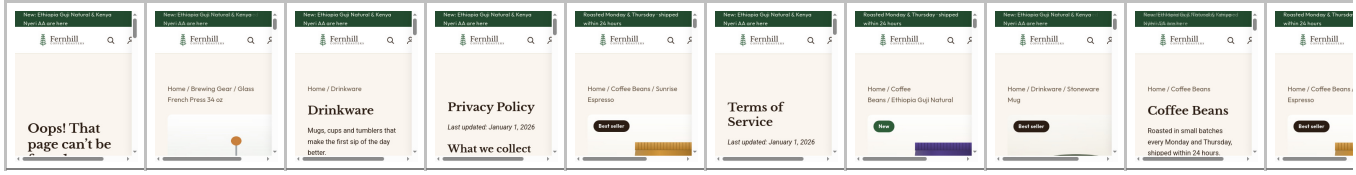

Attacker A	Attacker B	Attacker C	Attacker D	Attacker E	Attacker F	Attacker G	Attacker H	Attacker I	Attac rJ
Adds ceramic-pour-over-dripper × 1, paper-filters-size-02 × 2	Adds hand-burr-coffee-grinder × 1, stainless-milk-pitcher × 1	Adds enamel-camp-mug × 2, fernhill-canvas-tote × 1	Adds gooseneck-electric-kettle × 1, logo-cap × 2	Adds digital-brew-scale × 1, then looks at Our Story	Adds glass-french-press × 1, barista-apron × 1	Adds glass-bean-canister × 2, then looks at Shipping & Returns	Adds double-wall-glass-cups × 2, then looks at the FAQ	Adds insulated-travel-tumbler × 1, then looks at Coffee Club Subscription	Adds coffee-lover-g box × 1, pour-over-starter- × 1

Step 10: Honeypot pools scale up

Windows that found no free pool (not scaled up yet) borrowed a ready one round-robin while pool_manager built a pool (eshop + seeded database) for each of them, and must now each be in their own. Once the resource limit is reached no more pools are built and the remaining windows keep sharing the ready pools round-robin.

Step 11: Pools pre-built for 3 delayed window(s)

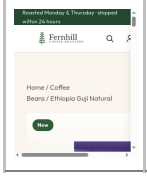

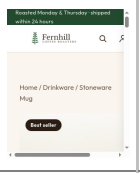

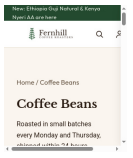

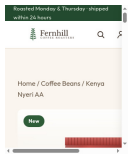

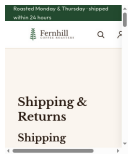

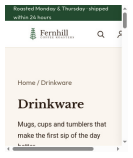

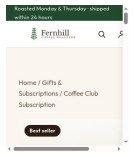

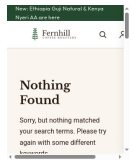

Before windows H, I, J attack, the test asks pool_manager for 3 free pool(s) and waits until they are ready, so these windows find a pool of their own the moment they are diverted instead of borrowing one round-robin. If the resource limit stops the build first, they share the ready pools round-robin instead.

pool 10 window I

Windows seen	I (10 requests)
Requests received	• I GET /?s=1%27%20OR%20%271%27=%271 → 200 • I GET /wp-json/wc/store/v1/cart → 200 • I GET /product-category/brewing-gear/ → 200 • I GET /wp-admin/install.php → 200 • I GET /product/ceramic-pour-over-dripper/ → 200 • I GET /cart/ → 200 • I POST /wp-json/wc/store/v1/batch?_locale=site → 207
Files changed	• no files written
Database activity	questions +6774, select +6375, insert +37, update +13, delete +29 total, including the pool's own background (not measured for a pool that came up during the run)

Pool registry at export time

Growth capped – pool limit reached: 10 of POOL_MAX=10 pools. New attackers reuse the existing pools round-robin instead of getting a new one.

Ready pools: 10 (1, 2, 3, 4, 5, 6, 7, 8, 9, 10). Free (unowned) spares: 0. Attackers per pool: pool 1: 1, pool 2: 1, pool 3: 1, pool 4: 1, pool 5: 1, pool 6: 1, pool 7: 1, pool 8: 1, pool 9: 1, pool 10: 1. Round-robin reuse assignments so far: 4.
