Honeypot IDS – Pool test report

Generated: 2026-10-17 08:29:00
Target: ids (local) (https://localhost)
Patterns: A: CVE-2024-2387, CVE-2024-1071; B: CVE-2025-47577, CVE-2025-4403; C: GENERIC-WP-003, GENERIC-WP-002; D: CVE-2024-27956, CVE-2024-1071; E: CVE-2022-0739, CVE-2025-4403; F: CVE-2024-2879, GENERIC-WP-002; G: CVE-2023-2986, CVE-2024-1071; H: CVE-2025-2266, CVE-2025-4403; I: GENERIC-SQLI-001, GENERIC-WP-002; J: GENERIC-XSS-001, CVE-2024-1071
Windows: 10
Session tamper-proofing: 4 clearing(s) and 2 forgery(ies), in random windows

---

Result

EXCLUSIVE **Every user has a honeypot pool of their own**

- User A → pool 1, User B → pool 2, User C → pool 3, User D → pool 7, User E → pool 4, User F → pool 5, User G → pool 6, User H → pool 8, User I → pool 10, User J → pool 9.

What is being tested

Users are told apart by session, not by address. Each test window has its own cookie jar and its own User-Agent and language, so the proxy sees 10 separate users. By default every flagged session is given a honeypot pool **of its own** (an eshop container with its own seeded database): the router hands a new user a free ready pool no other session owns, and the pools scale with the user sessions – a session that finds no free pool borrows one round-robin while pool_manager builds one for it, then moves there. Scaling stops at the configured resource limit (POOL_MAX_MEMORY_MB / POOL_MAX_CPUS / POOL_MAX) or when the host is short of memory, CPU or disk; from then on further users share the ready pools in strict round-robin order.

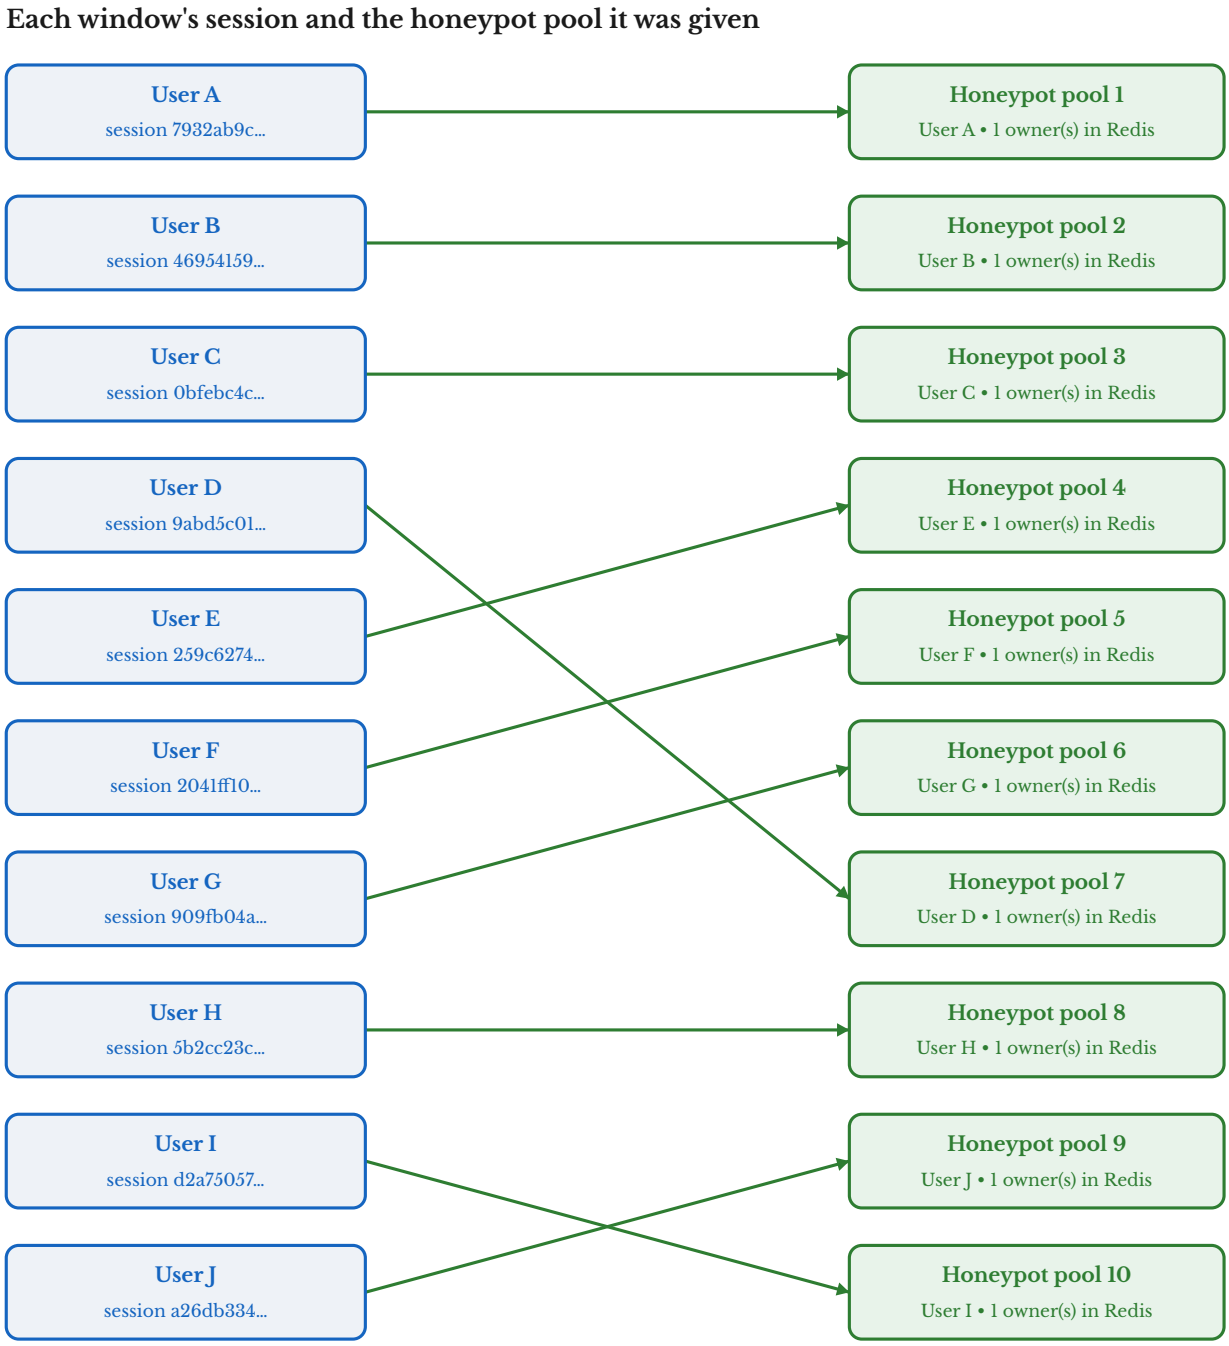

Figure 1. One arrow per test window, from its session to the honeypot pool the router bound it to. Green: the pool belongs to that window alone. Orange: shared under resource pressure (designed). Red: shared or merged without a reason. Grey: not bound.

Windows

Window	Session	Honeypot pool	Language	User-Agent (tail)
User A	7932ab9c...	pool 1	en-US,en;q=0.9	6.11.2 Chrome/140.0.0.0 Safari/537.36 PoolTest/A

Session tamper-proofing

Between steps, random windows tampered with their own session. Some **cleared** their data the way a regular visitor does from the browser's settings (every cookie of the site, its localStorage and sessionStorage, or both): the stack should still recognise the window by its passive fingerprint (TLS hello, User-Agent, Accept-Language, IP) and keep it on its session. Others **forged** it: their SERVERID cookie was rewritten to an invented session, or to another window's session (a hijack attempt), with a made-up signature. The real cookie is "<session id>.<HMAC>" and only the proxy holds the key, so a forged one must be rejected as not signed by the server – logged in Redis (*session_cookie_rejections*, by the SHA-1 of the value, matched here against the value planted) – and the window recovered into its own session, never the claimed one. A fake session written into localStorage / sessionStorage is never sent to the server, so it must change nothing. A window that lost its cookies also lost WooCommerce's cart cookie, so its cart starts over there. Random seed: 230384784.

4 clearing(s): 4 kept their session, 0 got a fresh one. 2 forgery(ies): 2 rejected by the proxy.

Time	Before step	Window	Tampering	Session before	Session after	What the stack did
0:53	5: User C attacks with GENERIC-WP-003	**User G**	forged its session cookie to another window's session id (made-up signature) SERVERID = 9abd5c018288ea… (claims session 9abd5c01)	909fb04a… production	909fb04a… production	**rejected** **same session** rejected (bad_signature, scored +50 as tampering); kept its session, served by production
1:02	6: User D attacks with CVE-2024-27956	**User J**	cleared its cookies 10 cookie(s) (SERVERID, fh_cart, sbjs_current_add, sbjs_first,	a26db334… production	a26db334… production	**same session** kept its session, served by production

Scaling and latency

pool_manager adds one honeypot pool (an eshop container plus its own database seeded from production) for every user session that finds no free pool, up to the resource limit. These figures come from pool_manager's own event log (build phases, hand-overs with their wait time, resource-limit changes) and from the windows themselves (routing read after every step and every 2 s while waiting; the duration of each page load).

Windows	10, of which 3 attacked only after pools were pre-built for them

Run time	9:49
Resource limit	12288 MB, 12 CPUs, POOL_MAX 10 (a pool reserves 768.0 MB / 0.75 CPUs); 10 pool(s) exist, room for 0 more
Pools added during the run	6 built; build time median 56 s, max 87 s
Round-robin while not scaled yet (case A)	3 window(s) borrowed a pool; moved to their own after median 45 s, max 73 s
Round-robin at the resource limit (case B)	0 window(s) share a pool for good; limit first reached at 3:50 (pool limit reached: 10 of POOL_MAX=10 pools)
Forced scale-down at the end	10 → 3 pool(s) in 39 s
Pre-build for the delayed windows	3 pool(s) ready after 100 s

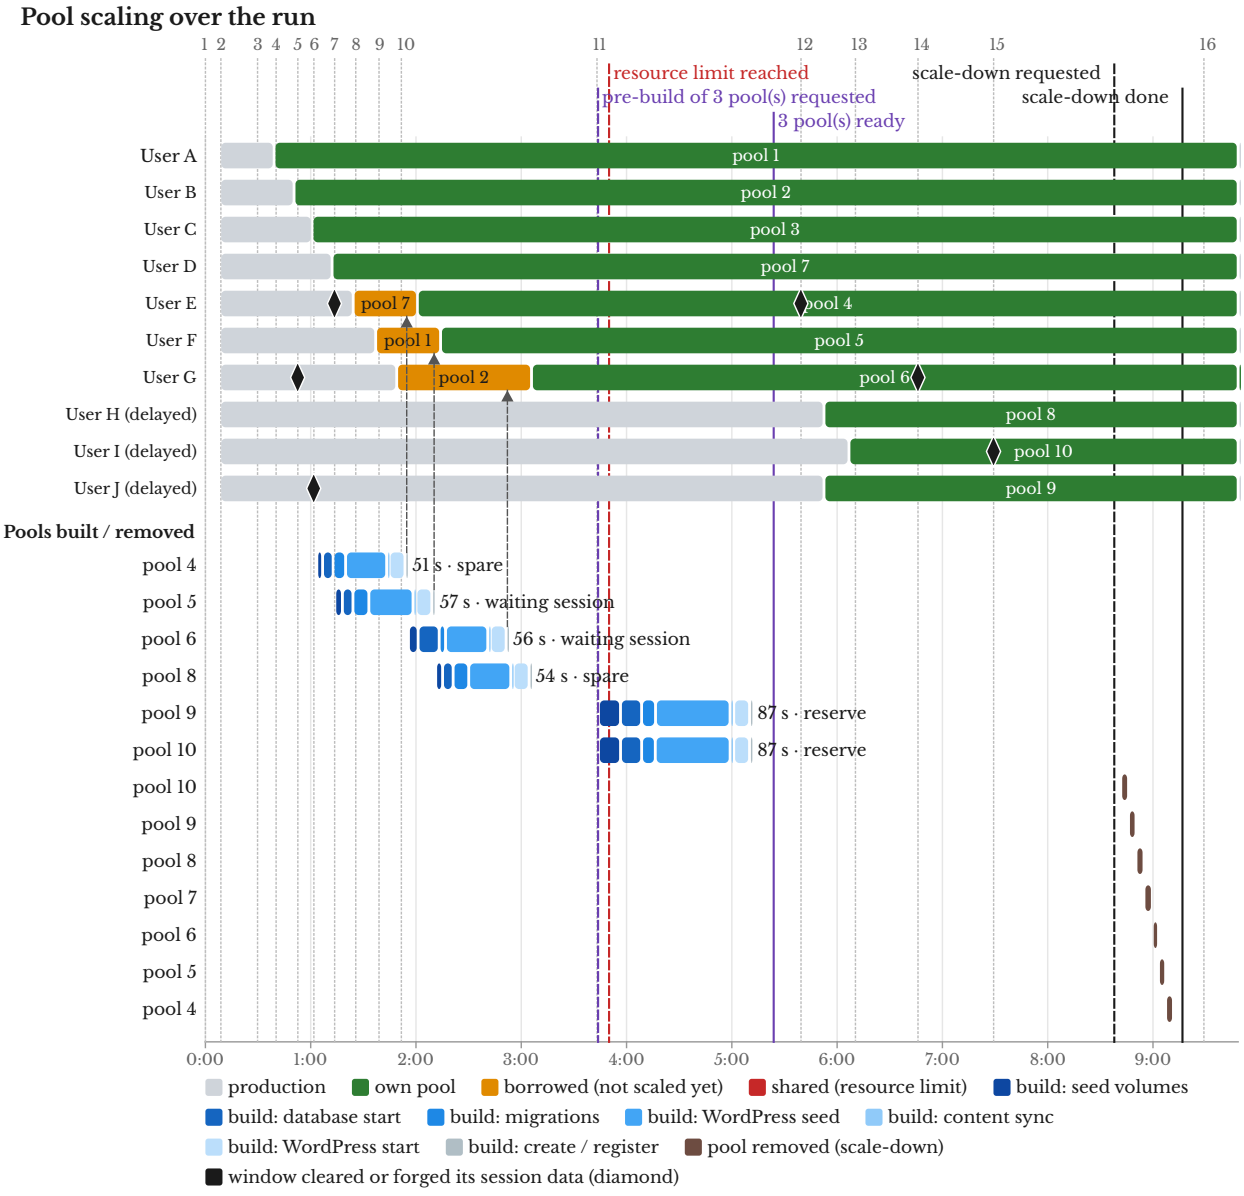

Figure 2. Where each window was served over the run (grey: production, green: its own pool, orange: a borrowed pool while its own was being built, red: shared because the resource limit was reached), and every pool built during the run, its phases shaded dark to light. Dashed grey arrows: a finished pool handed to the

window that waited for it. Numbered dotted lines: the steps below. Black diamonds: a window cleared or forged its session data.

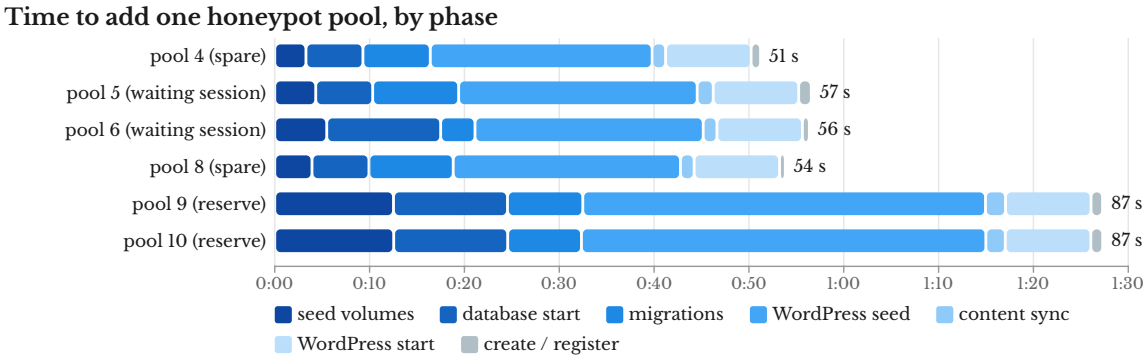

Figure 3. Latency of adding one honeypot pool: wall time from the decision to build it until it was registered healthy, split into pool_manager's phases.

Pool	Built for	Started	Build time	Phases
4	spare	1:03	51 s	seed volumes 3 s, database start 6 s, migrations 7 s, WordPress seed 23 s, content sync 1 s, WordPress start 9 s
5	waiting session	1:14	57 s	seed volumes 4 s, database start 6 s, migrations 9 s, WordPress seed 25 s, content sync 2 s, WordPress start 9 s
6	waiting session	1:56	56 s	seed volumes 5 s, database start 12 s, migrations 4 s, WordPress seed 24 s, content sync 1 s, WordPress start 9 s
8	spare	2:11	54 s	seed volumes 4 s, database start 6 s, migrations 9 s, WordPress seed 24 s, content sync 1 s, WordPress start 9 s
9	reserve	3:44	87 s	seed volumes 13 s, database start 12 s, migrations 8 s, WordPress seed 42 s, content sync 2 s, WordPress start 9 s
10	reserve	3:44	87 s	seed volumes 13 s, database start 12 s, migrations 8 s, WordPress seed 43 s, content sync 2 s, WordPress start 9 s

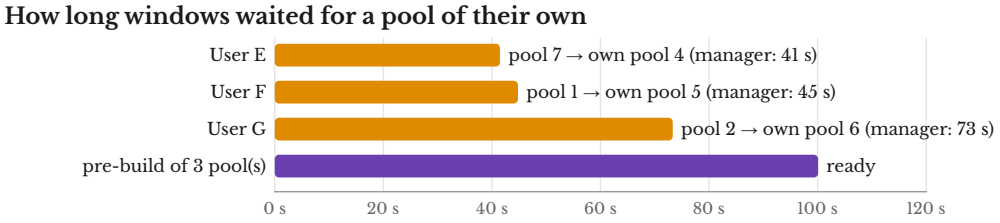

Figure 4. Orange: time a window spent on a borrowed pool (assigned round-robin because no pool was free yet) until it was moved to the pool built for it, as seen by the window (2 s resolution); pool_manager's own measurement in brackets. Red: the window was left on the borrowed pool because the resource limit was reached. Purple: time to pre-build the pools for the delayed windows.

Figure 5. Memory and CPU of the honeypot pool containers (eshop + database) only, and the number of pools registered ready with the router (docker stats every 10 s, every 3 s around the scale-down). CPU is the sum over the pool containers divided by the host's 20 logical processors, so 100% means every core busy. The memory panel's grey line is the whole host's RAM in use (every service, not just the pools). Dashed lines: green a pool finished building, red the resource limit was reached, brown a pool was removed. Shaded: the forced scale-down at the end of the run.

Why pool memory is below the budget

The figure's memory panel counts the honeypot pool containers only. A WordPress pool idles far below both its budget charge and its container limit, so 10 pools use far less than a 12 GB budget suggests; the host as a whole (grey line) is higher because it runs everything else too.

Pool containers, measured peak	4,189 MB across 10 pools (~419 MB per pool) — this is what the figure's blue line shows
Budget charge per pool	768 MB (POOL_RESERVE_MEM_MB) — what the scaling budget counts, deliberately above measured use as headroom
Container memory limit per pool	1536 MB (1024 eshop + 512 database) — the hard ceiling a pool can reach, rarely approached at rest
Whole host RAM	14,587 MB in use of 15,992 MB total (grey line) — includes production, Redis, Suricata and everything else, so it sits well above the pool containers alone

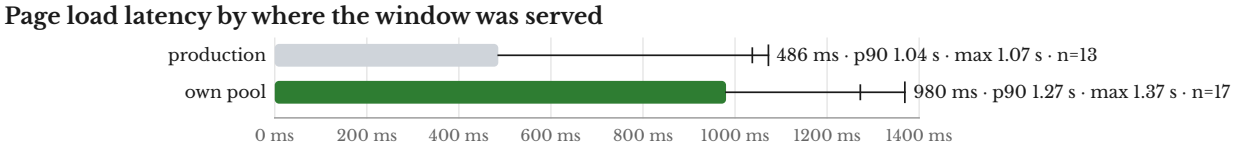

Figure 6. Latency probes: the same product page loaded by one window at a time, three times during the run (all windows on production, after the scale-up, at the end), timed from navigation start to load finished and grouped by where that window was routed right after. Bar: median; short tick: 90th percentile; line end: slowest load.

Round-robin assignment

A diverted session is only ever put on a pool another session uses in two situations, both handled round-robin over the ready pools:

A. Not scaled up yet (no free pool, more can be built)

Window	Borrowed	From	Until	Waited	Outcome
User E	pool 7	1:13	1:55	41 s (pool_manager: 41 s)	moved to its own pool 4
User F	pool 1	1:26	2:10	45 s (pool_manager: 45 s)	moved to its own pool 5
User G	pool 2	1:39	2:52	73 s (pool_manager: 73 s)	moved to its own pool 6

B. Resource limit reached (no more pools can be built)

Growth capped at 3:50: pool limit reached: 10 of POOL_MAX=10 pools

Not observed: the resource limit was reached, but every window diverted afterwards still found a free pool (a spare built before the limit), so nobody had to share.

Scale-down

pool_manager scales down a pool once no request has reached it for POOL_IDLE_TIMEOUT_SECONDS = 1800 s (30:00): its users' assignments are dropped (a returning user is assigned afresh) and pools above the spare count (1) are removed with their volumes, freeing what they reserved. Compose-declared pools are only freed, never removed. Waiting that long is not practical in a test, so the run ends by forcing it: the windows stop sending requests, their sessions are released, and pool_manager removes the pools that are no longer needed at once. Other sessions' pools are not touched.

Requested at	8:38
Sessions released	10
Finished	after 38.9 s
Pools	10 → 3 (1, 2, 3, 4, 5, 6, 7, 8, 9, 10 → 1, 2, 3)
Pools removed	pool 10 (4.4 s), pool 9 (4.2 s), pool 8 (4.5 s), pool 7 (4.8 s), pool 6 (3.5 s), pool 5 (4.1 s), pool 4 (4.4 s)
Reserved by container limits	7,680 MB / 7.5 CPUs → 2,304 MB / 2.25 CPUs
Memory in use (measured, pool containers)	4,125 MB → 1,398 MB (-2,726 MB)
CPU in use (measured, pool containers)	3 % → 0 % of all 20 CPUs
Containers running	20 → 6

Reassignment after removal

A removed pool's owner keeps its session cookie; its pool assignment was dropped when the pool went. Sent back to the shop once, the router reassigns it rather than routing to the pool that no longer exists. (The forced scale-down drops assignments on purpose; in normal operation idle scale-down only removes pools no request has reached, so there is usually no active owner to move.)

Window	Removed pool	Reassigned to	
User D	pool 7	production (fresh session)	reassigned
User E	pool 4	production (fresh session)	reassigned
User F	pool 5	production (fresh session)	reassigned
User G	pool 6	pool 1	reassigned
User H	pool 8	production (fresh session)	reassigned
User I	pool 10	production (fresh session)	reassigned
User J	pool 9	production (fresh session)	reassigned

Every window whose pool was removed was moved to a surviving pool or given a fresh session on its next request.

Cart persistence

A visitor diverted to a honeypot is served by a different database, so WooCommerce's own cart session does not exist there. The storefront therefore carries the cart in a cookie and rebuilds it on whichever instance serves the next request. Each window filled its cart on production; the cart was then read back after every step, through the same cookies and routing as the window's own traffic.

Where a window cleared its cookies (marked ◆), WooCommerce's cart cookie went with them, so the cart it filled is gone from the browser from that step on and an empty cart there is expected. If a cart shows up again after that, the browser did not bring it back: the stack restored it, and the report notes it below the table. That restored cart is then the one the later steps are compared with. Clearing only localStorage or sessionStorage leaves the cart cookie in place, so the cart must stay as it was.

Step	User A	User B	User C	User D	User E	User F	User G	User H	User I	User J
All windows open the shop	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production	no cart yet on production

J	CVE-2024-1071	Ultimate Member SQL injection	diverted after 1	pool 9

Step by step

All windows move in every step. A user's pool must appear in their own step, differ from the earlier ones, and never change afterwards – except once, from a pool it only borrowed while its own was being built to that new pool.

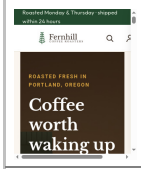

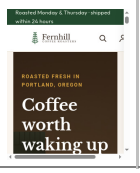

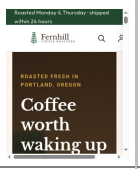

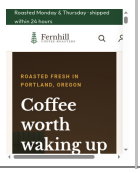

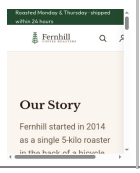

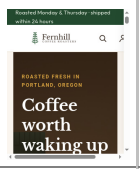

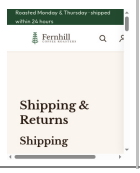

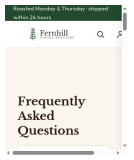

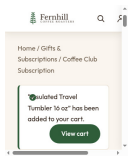

Step 1: All windows open the shop

10 new sessions, all routed to production.

User A	User B	User C	User D	User E	User F	User G	User H	User I	User
Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browses the shop	Browse the sho
PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRODUCTION no pool • score 0	PRO UCT N no poo score 0
cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty	cart empty
									

Step 2: Every window fills its cart

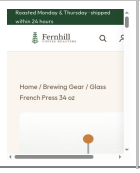

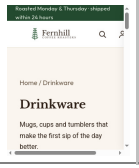

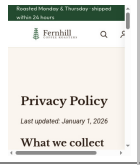

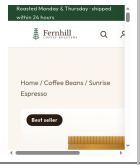

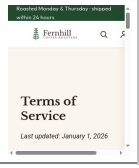

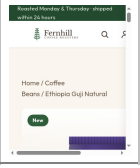

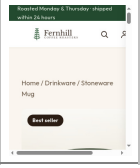

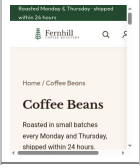

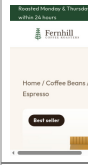

Each window adds its own products. These carts are the baseline: they must look exactly the same after the session is routed to a honeypot pool.

User A	User B	User C	User D	User E	User F	User G	User H	User I	User
Adds ceramic-pour-over-dripper × 1, paper-filters-size-02 × 2	Adds hand-burr-coffee-grinder × 1, stainless-milk-pitcher × 1	Adds enamel-camp-mug × 2, fernhill-canvas-tote × 1	Adds gooseneck-electric-kettle × 1, logo-cap × 2	Adds digital-brew-scale × 1, then looks at Our Story	Adds glass-french-press × 1, barista-apron × 1	Adds glass-bean-canister × 2, then looks at Shipping & Returns	Adds double-wall-glass-cups × 2, then looks at the FAQ	Adds insulated-travel-tumbler × 1, then looks at Coffee Club Subscription	Adds coffee-lover-g box × 1, pour-over-starter- × 1

Step 10: Honeypot pools scale up

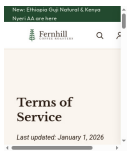

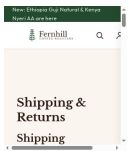

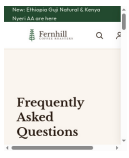

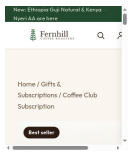

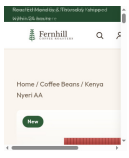

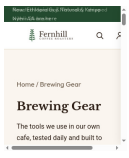

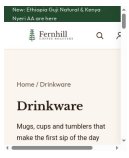

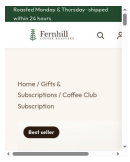

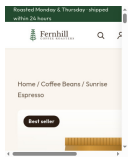

Windows that found no free pool (not scaled up yet) borrowed a ready one round-robin while pool_manager built a pool (eshop + seeded database) for each of them, and must now each be in their own. Once the resource limit is reached no more pools are built and the remaining windows keep sharing the ready pools round-robin.

Step 11: Pools pre-built for 3 delayed window(s)

Before windows H, I, J attack, the test asks pool_manager for 3 free pool(s) and waits until they are ready, so these windows find a pool of their own the moment they are diverted instead of borrowing one round-robin. If the resource limit stops the build first, they share the ready pools round-robin instead.

Step 12: Delayed windows H, I, J attack together

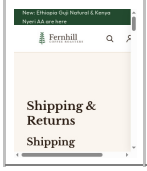

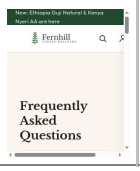

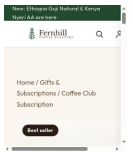

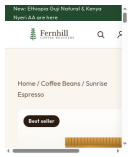

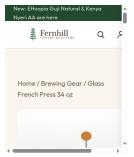

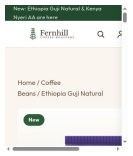

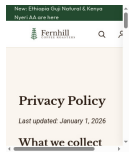

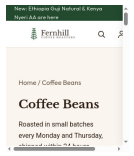

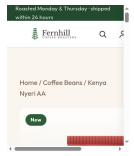

These windows attack only now that pools were built for them: each must get a free pool of its own at once (no borrowing) -- unless the resource limit stopped the build, in which case they share the ready pools round-robin.

Requests received	• G GET /terms-of-service/ → 200 • G GET /wp-json/wc/store/v1/cart → 200 • G GET /product/ceramic-pour-over-dripper/ → 200 • G GET /product-category/brewing-gear/ → 200 • G GET /product/glass-french-press/ → 200 • G GET /shipping-returns/ → 200 • G GET /product/ethiopia-guji-natural/ → 200 • G GET /product-category/drinkware/ → 200
Files changed	• no files written
Database activity	questions +8502, select +7896, insert +87, update +84, delete +48 total, including the pool's own background (not measured for a pool that came up during the run)

pool 7 window D

Windows seen	D, E (48 requests)
Requests received	• D GET /wp-content/plugins/wp-automatic/inc/csv.php?q=1%27%20UNION%20SELECT%20user_login%2Cuser_p → 404 • D GET /wp-json/wc/store/v1/cart → 200 • D GET /about/ → 200 • E GET /wp-admin/admin-ajax.php?action=bookingpress_front_get_category_services&total_service=1%2 → 400 • E GET /wp-json/wc/store/v1/cart → 200 • E GET /product/glass-french-press/ → 200 • D GET /product/sunrise-espresso-blend/ → 200 • E GET /shipping-returns/ → 200
Files changed	• no files written
Database activity	**questions +6542, select +6157, insert +86, update +60, delete +19** beyond its own background total questions +14593, select +13644, insert +136, update +93, delete +69; the background (healthchecks, WP cron, content sync) was measured while every window was still on production

pool 8 window H

Windows seen	H (13 requests)
Requests received	• H GET /?action=cwmpUpdateOptions&option=default_role&value=administrator → 200 • H GET / → 200 • H GET /wp-json/wc/store/v1/cart → 200 • H GET /product-category/coffee/ → 200 • H GET /?action=dnd-wc-upload-file&name=shell.php → 404 • H GET /product/ceramic-pour-over-dripper/ → 200 • H GET /cart/ → 200
Files changed	• no files written
Database activity	questions +6661, select +6225, insert +72, update +34, delete +35 total, including the pool's own background (not measured for a pool that came up during the run)

pool 9 window J

Windows seen	J (14 requests)
Requests received	• J GET /?s=%3Cscript%3Ealert(1)%3C/script%3E → 200 • J GET / → 200 • J GET /wp-json/wc/store/v1/cart → 200 • J GET /product-category/brewing-gear/ → 200 • J GET /wp-admin/admin-ajax.php?action=um_get_members&directory_id=1%27%20UNION%20SELECT%20user_l → 400 • J GET /product/ceramic-pour-over-dripper/ → 200 • J GET /cart/ → 200 • J POST /wp-json/wc/store/v1/batch?_locale=site → 207
Files changed	• no files written
Database activity	questions +4748, select +4361, insert +51, update +66, delete +28 total, including the pool's own background (not measured for a pool that came up during the run)

pool 10 window I

Windows seen	I (9 requests)
Requests received	• I GET /?s=1%27%20OR%20%271%27=%271 → 200 • I GET /wp-json/wc/store/v1/cart → 200 • I GET /product/kenya-nyeri-aa/ → 200 • I GET /wp-admin/install.php → 200 • I GET /product/ceramic-pour-over-dripper/ → 200 • I GET /cart/ → 200
Files changed	• no files written
Database activity	questions +4253, select +3957, insert +53, update +31, delete +22 total, including the pool's own background (not measured for a pool that came up during the run)

Pool registry at export time

Growth capped – pool limit reached: 10 of POOL_MAX=10 pools. New users reuse the existing pools round-robin instead of getting a new one.
Ready pools: 10 (1, 2, 3, 4, 5, 6, 7, 8, 9, 10). Free (unowned) spares: 0. Users per pool: pool 1: 1, pool 2: 1, pool 3: 1, pool 4: 1, pool 5: 1, pool 6: 1, pool 7: 1, pool 8: 1, pool 9: 1, pool 10: 1. Round-robin reuse assignments so far: 10.
